UX Flow chart

In UX, a flow chart is important to assist us to actualize user experience, checking product logic, and the relationship between upper and lower levels. First, we must comprehend the users, and then we must compare the user experience of competitors. Finally, determine the scenarios for user usage. We involve users at the start of the project and collect feedback once the design has taken shape to guarantee that our design approach is meaningful, according to a relatively well-developed interaction process.

In this flow chart for a film festival website, I created two scenarios that combined five separate scenarios. The first scenario is standard in that it determines whether the user is a new user and then requires the new user to create an account. Users can browse the film festival page, select a recommended film festival on the main page, or search for a film festival by clicking. The filter is then used to determine the sort of film festival and the application fee, among other things. Then check to see whether there are any projects in the account, and if not, add them. Users with projects must choose one from a list of projects in order to alter, re-upload, or replace the poster image. Finally, confirm the fee and judge the fee issue; if the film festival is free, you may submit works directly; otherwise, you must pay a price before you can submit, and you can cancel the submission request at the same time. When the process is finished, the user can return to the home page to complete the cycle. The second scenario is for purposeful user actions. Still, if the user clearly wants to search for film festivals or choose a film festival to submit their work to, they can go straight to the first tab bar to execute a series of operations, and the same can be done to filter the types of film festival fees for payment judgment. In addition to basic activities, users can use the second tab bar to directly manage their work, create new projects, and add or replace project posters. When a person wants to exit a film submission, they can do so by going to the Submissions

tab bar and finding the document they want to exit. This tabbed form of operation is very convenient.
